The Future of Renewable Energy in Urban Development
By Sarah Johnson
Published March 2, 2026
• Last updated March 3, 2026
The integration of renewable energy sources into urban development has become a critical focus for city planners and environmental scientists worldwide. As populations continue to grow and cities expand, the demand for sustainable energy solutions has never been more pressing.
The Current State of Urban Energy
Urban areas consume approximately 75% of global energy and produce over 70% of carbon emissions. This disproportionate impact makes cities the primary battleground for climate change mitigation efforts. Traditional energy infrastructure, built on fossil fuels, is proving inadequate for the needs of modern cities while contributing significantly to environmental degradation.
Innovative Solutions on the Horizon
Several innovative approaches are emerging to address these challenges. Solar panel integration into building designs has evolved from rooftop installations to building-integrated photovoltaics (BIPV), where solar cells are incorporated directly into building materials such as windows, facades, and roofing tiles.

Diagramme de classes

Concernant le UserState.DELETED, il permet de représenter un compte supprimé (qui ne contient donc plus aucune donnée personnelle hormis le nom) puisque nous devons conserver le nom de l'auteur d'un article. Un tel compte n'est donc plus accessible et ne sert qu'à référencer le nom de l'auteur.

Le UserRole.READER permet à de simples lecteurs (pas besoin de compte pour lire les articles) d'avoir un compte et donc des préférences ou commenter les articles par exemple. On peut aussi imaginer que c'est par ce moyen que l'on peut "candidater" au rôle de journaliste. Il est possible de supprimer cela sur demande du client.
